Chokeberries, as one of the richest plant sources of phenolics, represent a natural nutraceuticals, which play important role in human nutrition due to their antioxidant potential. Processing of chokeberry juice generates waste by-product still containing high amounts of polyphenolics, which can be extracted. Problem with polyphenols extract instability can be solved by microencapsulation techniques. Encapsulation of chokeberry extracts using different carriers (maltodextrin, skimmed milk, gum arabic, alginate, inulin) by two different techniques, electrostatic extrusion and spray drying was employed. Microencapsulated systems were examined (FTIR, SEM, particle size, zeta potential, moisture content). For investigation of microencapsulated polyphenols bioavailability, their digestive stability and release from food matrix, *in vitro* simulated digestion method was employed. The release profiles from microbeads were investigated determining the total polyphenols and anthocyanins, as well as individual phenolics. Our result showed that stability of polyphenols, especially anthocyanins could be improved using different microencapsulation technologies. Both microencapsulation techniques were suitable for particles production, as efficient systems for the prolonged polyphenols delivery and increased stability. Since the subject of this examination is current plant species, chokeberry extract effects on blood pressure were examined for the first time through *in vivo* monitoring of systemic and regional hemodynamic and biochemical parameters in the model of essential hypertension. A four week extract administration in spontaneously hypertensive rats significantly reduced systolic and pulse pressure, associated with increased diuresis. Chokeberry extracts and prepared microbeads, due to their antioxidant potential, represent a promising food additive for incorporation into dietary supplements or functional food.
